			ART UNIT 1797	PAPER NUMBER
			MAIL DATE 11/26/2007	DELIVERY MODE PAPER

**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

<b>Office Action Summary</b>	Application No. 10/634,663	Applicant(s) SMITH ET AL.	
	Examiner Nathan A. Bowers	Art Unit 1797	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 21 September 2007.
- 2a) ☐ This action is **FINAL**.                      2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-11, 19-21 and 23-53 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1, 2-11, 19-21 and 23-5 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All    b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## DETAILED ACTION

### *Continued Examination Under 37 CFR 1.114*

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 21 September 2007 has been entered.

### *Claim Rejections - 35 USC § 103*

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any

evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

1) Claims 1, 3-11, 19-21, 23-34 and 48-53 are rejected under 35 U.S.C. 103(a) as being unpatentable over Smith (US 5935847) in view of either Toner (US 6759245) or Turner (US 5912177), and further in view of Codner (US 5686304).

With respect to claims 1 and 48, Smith discloses a closed cell culture container (Figure 2:20) comprising a first flexible sidewall (Figure 2:22) connected to a portion of an opposing second flexible sidewall (Figure 2:24) along a peripheral seal to define a containment area (Figure 2:26). This is disclosed in column 6, lines 12-33. Column 2, lines 24-31 and column 3, line 59 to column 4, line 46 teach that the first and second sidewalls are constructed from flexible polymeric materials that permit cellular respiration. Column 5, lines 39-45 indicate that the sidewalls are constructed from ethylene vinyl acetate. A polystyrene layer (Figure 2:12) is provided to promote cell adhesion to the inside surface of the culture container. Smith, however, does not expressly state that a fibrin matrix layer is positioned on a portion of the interior surface of the first or second sidewalls of the cell culture container.

Toner discloses a cell culturing device (Figure 1) that includes a chamber divided by a gas permeable, liquid impermeable polymeric membrane (Figure 2:30). Cells (Figure 2:40) are seeded upon the membrane, and gases from an oxygenated liquid stream (Figure 2:20) are allowed to diffuse through the membrane in order to contact the cells. This is disclosed in

column 3, lines 1-25 and column 7, line 10 to column 8, line 19. Column 9, lines 8-42 indicate that the membrane may be constructed from a variety of polymer compounds arranged in a single or multi-layered assembly. Column 11, lines 27-56 teach that the membrane (Figure 1:30) is coated with a fibrin matrix layer (Figure 1:41) to increase cell adhesion.

Turner discloses a polymer bag that forms a closed container for holding a cell culture. Column 3, lines 47-65 state that the bag is permeable to gases vital for cellular metabolism. Column 2, lines 43-50 indicate that a fibrin matrix is immobilized upon the inner walls of the bag in order to facilitate the adhesion of cells.

Smith, Toner and Turner are analogous art because they are from the same field of endeavor regarding cell culture containers.

At the time of the invention, it would have been obvious to include a fibrin matrix layer positioned on the interior surface of the polystyrene layer disclosed by Smith. In column 6, line 65 to column 7, line 19, Smith teaches that it is desirable to provide a culture vessel which includes sidewalls that are capable of accommodating adherent dependent cells. Toner and Turner each teach that fibrin, when applied to a polymer substrate, will enhance cell immobilization to the polymer substrate. In this way, Smith's invention would be improved through the addition of a fibrin matrix layer because the fibrin matrix would allow the cell culture container to better accommodate a wider range of adherent dependent cell types.

The combination of Smith and Toner/Turner still differs from Applicant's claimed invention because it is not entirely clear if the inner surface of Smith's container comprises an ethylene vinyl acetate copolymer. The Figures predominantly indicate that the inner surface of

the container is covered by a polystyrene layer (Figure 8:28) as opposed to an ethylene vinyl acetate copolymer layer (Figure 8:24).

Codner discloses a cell culture apparatus. In column 6, line 53 to column 7, line 5, Codner teaches that the walls defining the apparatus comprise an inner surface formed from an ethylene vinyl acetate copolymer.

Smith, Toner, Turner and Codner are analogous art because they are from the same field of endeavor regarding cell culture bags.

At the time of the invention, it would have been obvious to form the inner surfaces of Smith's container from areas comprising polystyrene and fibrin materials as well as areas comprising ethylene vinyl acetate copolymers. As previously described above, polystyrene and fibrin are beneficial because they foster the growth of adherent cells. However, Smith teaches in column 7, lines 35-36 that ethylene vinyl acetate is more suitable for the culture of non-adherent cells, and, as evidenced by Codner, the use of ethylene vinyl acetate copolymers is well known in the art. It would have been obvious to ensure that some areas of Smith's inner surface are covered by fibrin and polystyrene to encourage the growth of adherent cells, and it would have been obvious to ensure that other areas of Smith's inner surface are covered by ethylene vinyl acetate copolymers to promote the culture of non-adherent cells.

With respect to claims 3 and 4, Smith, Toner/Turner and Codner disclose the apparatus set forth in the 35 U.S.C. 103 rejection above. In addition, Smith teaches in column 4, lines 11-46 that the gas permeable material is either EVA, polyolefin, polyamide or styrene. The

polymeric material of the first sidewall is a styrene and hydrocarbon multi-component polymer blend.

With respect to claims 5-11, 49 and 50, Smith, Toner/Turner and Codner disclose the apparatus set forth in the 35 U.S.C. 103 rejection above. In addition, Smith teaches that the gas permeable material is either a monolayer or a multilayer structure. Monolayer cell culture containers are well known in the art, and Figures 1 and 4 illustrate multilayer embodiments. A polystyrene layer (Figure 4:12) and a skin layer (Figure 4:18) are provided in addition to the substrate layer (Figure 4:14). Column 5, lines 7-18 teach that the skin layer and substrate layer are formed on the outer surface of the polystyrene layer, so that the inner surface of the polystyrene layer forms the interior surface of the culture chamber. The skin layer is formed from polyethylene copolymers and polypropylene copolymers. Column 4, lines 11-46 indicate that substrate layer is anywhere from 0-40% ethylene vinyl acetate copolymer. It is an intrinsic feature of the invention that the composition of the substrate and polystyrene layers can be manipulated in order to achieve any desired polymer distribution.

The claimed weight ratios are simply result effective variables. In the absence of new or unexpected results, it would have been obvious to optimize the composition of the substrate and skin layers. This optimization could simply be accomplished by producing different compositions and testing their ability to be used in cell culturing. See *In re Boesch*, 617 F.2d 272, 205 USPQ 215 (CCPA 1980).

With respect to claims 19-21, 23-26 and 51-53, Smith, Toner/Turner and Codner disclose the apparatus set forth in the 35 U.S.C. 103 rejection above. In addition, Smith states in column 2, lines 24-31 that the polystyrene layer (1<sup>st</sup> layer) has a thickness within the range of 0.0001 inches to 0.001 inches. Column 4, lines 47-56 indicate that the substrate layer (2<sup>nd</sup> layer) has a thickness of 0.004 inches to 0.025 inches. Column 4, lines 11-46 teach that the second layer is a multi-component polymer blend that includes styrene and hydrocarbon copolymer. Figure 2 indicates that the gas permeable EVA material is used in the construction of both the first and second sidewalls. The nature of the invention regarding copolymer content and layer thickness has already been described.

With respect to claims 27-32, Smith, Toner/Turner and Codner disclose the apparatus set forth in the 35 U.S.C. 103 rejection above. In addition, Smith states in column 2, lines 39-51 that the culture container has a oxygen permeability of 9-15 Barrers, a carbon dioxide permeability of 40-80 Barrers, a nitrogen permeability of 10-100 Barrers and a water vapor transmission rate of less than 20 (g mil/100 in<sup>2</sup>/day). Column 5, line 49 to column 6, line 8 indicates that the first and second sidewalls have a flexural modulus of 10,000-30,000 psi, and that the sidewalls are optically clear. The container is radiation sterilizable. Column 7, lines 39-44 indicate that at least one port (Figure 9:40) provides access to the containment area.

With respect to claims 34 and 35, Smith, Toner/Turner and Codner disclose the apparatus set forth in the 35 U.S.C. 103 rejection above. In addition, Smith states in column 6, line 66 to column 7, line 19 that the inside surfaces of the culture container can be modified in order to

determine to what areas cells are allowed to adhere. Accordingly, it would have been obvious to apply the fibrin matrix disclosed by Toner to any part of the container surface that is desired to promote cell adhesion. This intrinsically could pertain to the entire inner surface of the container, or just specific regions of the inner surface. If the culture container is intended to facilitate the growth of adherent cell types, then it would be obvious to apply the fibrin matrix to the entire sidewall interior surface. If the culture container is intended to facilitate the growth of adherent and non-adherent cell types, then it would be obvious to apply to fibrin matrix to just a part of the sidewall interior surface.

2) Claims 36-46 are rejected under 35 U.S.C. 103(a) as being unpatentable over Smith (US 5935847) in view of Toner (US 6759245)/Turner (US 5912177) and Codner (US 5686304) as applied to claim 1, and further in view of Delmotte (US 5989215).

With respect to claims 35-37, Smith, Toner/Turner and Codner disclose the invention set forth in the 35 U.S.C. 103 rejections above, however do not expressly disclose the nature of the fibrin matrix.

Delmotte discloses a method for forming a fibrin matrix that includes delivering a first solution of fibrinogen and factor XIII and a second solution of thrombin and calcium to a desired surface. This is disclosed in column 3, lines 31-44 and column 8, lines 3-15. In column 12, line 34 to column 13, line 20, Delmotte states that the amount of thrombin added to the fibrinogen solution is directly related to the pore size of the fibrin matrix product. Thrombin can be added in varying amounts in order to create a fibrin network characterized by pore diameters anywhere between 0.2-4 microns.

Smith, Toner/Turner, Codner and Delmotte are analogous art because they are from the same field of endeavor regarding cell culture systems.

At the time of the invention, it would have been obvious to form a fibrin matrix within the cell culture container disclosed by Smith and Toner by mixing a solution of fibrinogen with a solution of thrombin. In column 4, line 57 to column 5, line 16, Delmotte states that by separating fibrinogen and thrombin into two separate solutions, one is able to more easily manipulate the concentrations of fibrinogen and thrombin to effect change in the characteristics of the resultant fibrin film. In this way, the concentration of thrombin can be readily changed in order to create a fibrin matrix with a desired pore size.

With respect to claims 38-46, Smith, Toner/Turner, Codner and Delmotte disclose the apparatus set forth in the 35 U.S.C. 103 rejection above. In column 7, lines 29-32, Delmotte teaches that the components of the fibrinogen and thrombin are derived from human plasma. It would have been obvious to utilize recombinant components of fibrinogen and thrombin, as well. When the fibrin matrix is used in a bioreactor and not for treating a human being, it is less important to use fibrinogen and thrombin attained from human blood plasma. Techniques for creating recombinant biomolecules are well known in the art.

With respect to claim 47, Smith, Toner/Turner, Codner and Delmotte disclose the apparatus set forth in claim 37 as set forth in the 35 U.S.C. 103 rejection above. In addition, Delmotte discloses in column 8, lines 3-29 that fibrin is made from a first solution containing 10-40 IU/ml of fibrinogen and factor XIII, and a second solution containing 3-10,000 IU/ml of

thrombin and 45 micromoles/ml of calcium. Column 15, lines 1-15 disclose a method in which the fibrinogen and thrombin solutions are repeatedly applied to a surface in 0.3 ml increments. Column 18, lines 51-63 disclose a method in which 3.5 ml of the fibrinogen and thrombin solutions are mixed to form a fibrin matrix. The fibrinogen and thrombin solutions are incubated, and the formed fibrin matrix has a pore size of anywhere between 0.2-4 microns.

### ***Response to Arguments***

Applicant's arguments filed 21 September 2007 with respect to the 35 U.S.C. 103 rejections involving the combination of Smith and Toner have been fully considered and are persuasive. Therefore, these rejections have been withdrawn. However, upon further consideration, a new ground of rejection is made in view of the combination of Smith with either Toner or Turner and further in view of Codner.

The Turner reference clearly indicates that it is known in the art to coat the interior of a bag culture container with a fibrin matrix.

The Codner reference teaches that it is known in the art to construct a bag culture container such that the interior surface is formed from an ethylene vinyl acetate copolymer. Smith teaches in column 7, lines 35-36 that ethylene vinyl acetate is advantageous for the culture of non-adherent cells.

### ***Conclusion***

This is a non-final rejection.

No claims are allowed.
